Human and mouse sperm protein PH30 beta chain and related DNA - useful in contraceptive vaccines.

Example 2; Page 45-48; 85pp; English.

Human PH30 beta chain sperm protein, having a FEE integrin binding domain, is 58.9% identical to mouse and 56.5% identical to guinea pig PH30 beta. The protein may be produced recombinantly and used in a contraceptive composition containing an effective adjuvant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein in vivo, thereby preventing or substantially reducing the rate of sperm-egg fusion

Sequence 734 AA;

us-10-054-683-19.rag

```
Diagnosing cancer comprises contacting a biological sample isolated from a subject with an agent that specifically binds to a nucleic acid molecule, its expression product or fragment or an antibody that binds to the product or fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a method for diagnosing cancer, the method involves detecting the DNA or protein sequences of human cancer/testis (CT) antigens that are disclosed in the invention. The method of the invention is useful for detecting/diagnosing, treating and monitoring a cancer or condition characterised by the expression of a human CT antigen. The present amino acid sequence represents a human CT antigen of the condition of the conditio

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal cancer indicates that the patient is afflicted with prostate cancer.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB75177-ADB75631 represent marker CDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but

The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of sassessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                661 PPPVAIPARLPERRYIENIYHSKPMRWPFFLFIPFFIIFCVLIAIMVKVNFQRKKWRTED 720

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal control and cancer, and may be useful in gene therapy. Sequences given in ADB7517-ADB7531 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB75177-ADB75631 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                69

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          INKCOCSGAVCIMNPEAIHFSGVKIFSNCSFEDFAHFISKQKSQCLHNQPRLDPFFKQQA 384
                                                                                                                                                                                                                                                                                                                                                                                                     Human PH30 beta chain sperm protein, having an FEE integrin binding domain, may be recombinantly produced by vector-mediated gene expression in host cells, preferably mammalian cells e.g. Chinese hamster ovary (CHO) cell culture. It may be used in a contraceptive composition containing an effective adjuvant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein in vivo, thereby preventing or substantially reducing the rate of sperm to in vivo, the protein is also useful for identifying small molecules that disrupt sperm-egg interaction and fertilization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    APLLVYREKSNYVGATFQGKMCDANYAGGVVLHPRTISLESLAVILAQLLSLSMGITYDD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse PH30 beta chain sperm protein, having a QDE integrin binding domain, is 55.2% identical to guinea pig PH30 beta. The protein may be produced recombinantly and used in a contraceptive composition containing an effective adjuvant and an amount of sperm protein which is effective for the stimulation of antibodies which bind to sperm protein in vivo, thereby preventing or substantially reducing the rate of sperm-egg fusion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polypeptides, encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating or inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO

XX

N-PSDB; ACA66885.

The hundred and twenty two nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating tumor.

XX

Claim 11; Fig 90; 314pp; English.

XX

CD polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnosic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABU803560

CC specific cells, tassues obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html

The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide encoding sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 consideration or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. These are particularly useful for detecting tumour, colon tumour, breast tumour, prostate tumour, rectal tumour, or liver tumour, or liver tumour, or a fumulating the proliferation of ifferentiation of chondrocyte cells, for stimulating proliferation of pericyte cells, or for modulating normal human dermal fibroblast proliferation. The PRO nucleic acid or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probbes, or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genes, and its encoded secreted and transmembrane polypeptides,
ful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or
icyte proliferation, especially for treating lung tumors, arthritis or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes one hundred and eighty seven nucleic acids encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovacular, endothelial or angiogenic disorder in a mammal, e.g. cardiovacular, endothelial or angiogenic disorder in a mammal, e.g. cardiovacular, endothelial or angiogenic disorder in a mammal, e.g. cardiovacular, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Goddard A, Godowski PJ;

The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO protein of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  173
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating prollferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19

The invention relates to an isolated mucleic acid encoding a PRO polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate full length PRO cDNA. The PRO polypeptides are useful for chondrocyte stimulation, TNP-alpha stimulation, human dermal fibroblasts stimulation and for detecting the presence of tumour in an mammal. The PRO polypeptides are useful as molecular markers for protein electrophoresis polypeptides are useful as molecular markers for protein electrophoresis and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO and in affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents the amino acid sequence of a human secreted/transmembrane PRO polypeptide

Claim 11; Fig 90; 315pp; English

This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically cyoverned by information received from other cells and the immediate conversed by information is often transmitted by secretes cytotoxic polypeptides (for example mirogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins and receptors may be of use as pharmaceutical and diagnostic agence, such as in the blocking of receptor ligand interactions. The current invention provides the amino acid with the cDNA sequences encoding them. The novel proteins of the conditocytes. The nucleic acids of the invention may have cytostatic activities through the stimulation of the manufacture of a medicament for diagnosing or treating a tumour in a manufacture of a medicament for diagnosing or treating the amino con manumal. In addition, they may be useful for measuring or detecting the amino con expression of a tumour associated gene. The present sequence is the amino

Listing first 41 pirst 
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
